

# Dr. Nicholas Gonzalez Was Critical of Adult Vaccinations Shortly Before Death

**The late Dr. Nicholas Gonzalez wrote the following letter to Rebecca Fish, per the government's "Solicitation of Written Comments on the Draft National Adult Immunization Plan" prior to the comments deadline of March 24, 2015 and published in the Federal Register.**

Dear Ms. Fish:

I am a physician practicing in New York, a graduate of Brown, post-grad work at Columbia, medical school at Cornell, fellowship in cancer immunology under Robert A Good, M.D., Ph.D., for years President of Sloan-Kettering and the "Father of Modern Immunology".

I have reached the age of 67 years old, had only polio and tetanus vaccines as a child. I follow good nutritional practices, am in superb health with no minor or major diseases past or present and no infections over the past 60 years except a rare cold.

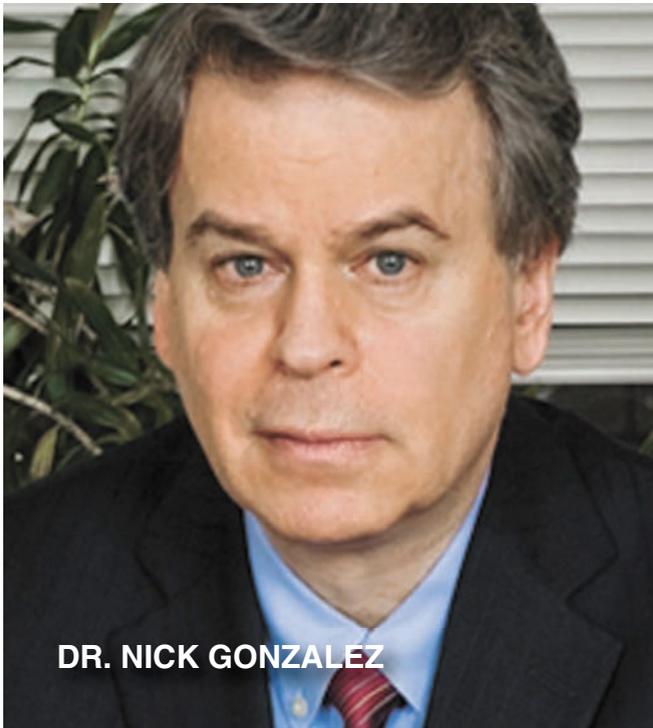

I am very troubled that the DHHS is now trying to implement forced vaccination schedules not only on children, but on adults. Most of these vaccinations as you must know have not been tested either for safety or efficacy. The most recent flu vaccine as I have read and believe to be the case was tested for neither safety nor efficacy but got passed through the FDA, perhaps because of drug company lobbying.

I survived the usual childhood illnesses without a problem as did my many friends and schoolmates, and believe firmly as a trained immunologist that these mild infections helped my im-

mune systems mature. I think this obsession with avoiding the usual childhood illnesses unnecessary and perhaps counterproductive. Even the dreaded polio, as it turns out through epidemiological investigations, was in most people a mild infection no more serious than a cold. Studies from the late 1940s showed that in urban areas up to 95% of the populations were positive for polio antibodies, yet with no history of any significant infection and certainly no neurological disability. Yet it's estimated that up to 40 million Americans may now be infected with the SV40 cancer virus as a result of contaminated polio vaccines. Was this risk worth the grand scheme to inoculate everyone for a disease than in most, despite government hysteria, was rarely a serious problem?

For most children as in my case and in the case of all my young friends at the time of my own infection, these childhood illnesses passed with no serious or lasting deficits. However, the same can no longer be said about vaccinations and the damage they cause. For example, if vaccinations are so safe, why has the government set up a "Vaccine Court" to pay out damage claims to victims of vaccination related disability, to this date amounting to billions.

There is no question autism rates are skyrocketing. When I was in medical school in the 1980s it was such a rare condition my professors spent maybe 5 minutes on it, advising us we would most likely never see a case in our professional lifetime. Now, it's estimated that perhaps up to 1 in 50 male children may be afflicted. Something is changing, and if it isn't the explosion of vacci-

**DR. NICK GONZALEZ**

nations, perhaps you can come up with a better idea. And this belief the only reason rates are higher is because now we are so smart we diagnose it better to today is nonsense; autism, with its head banging and obsessive behavior patterns was as easy to diagnose 30 years ago as it is today.

Vaccines still contain aluminum and mercury, both neurotoxins, and no one has yet proven they are safe as adjuvants. I've not found that controlled peer reviewed study.

The recent claims of fraud at the CDC over autism rates linked to vaccinations raise serious questions about the integrity of government scientists promoting vaccinations.

Vaccinations must remain optional, for the safety and health of our children.

Objective scientific studies on the safety and efficacy of vaccinations, not controlled by the manufacturers must be encouraged.

Wishful thinking on the part of vaccination proponents claiming safety and efficacy often with no data must be reported for what it is, non-science.

Adults and the parents of children must, in this

country of all countries where individual liberty is so valued, be allowed to make their own intelligent choices about their bodies, and about vaccinations.

Benjamin Rush, M.D., one of the leading Founding Fathers, a great physician in his day, warned that government involvement in health care decisions was a danger, to individual and societal health. He helped design provisions, like the Fourth Amendment, to protect us from government intrusion in our bodies and our health decisions. You should take this seriously.

American survived quite well without mandated vaccinations for children and adults, and we will survive better without such mandates.

The government knows these vaccinations carry serious and dangerous risks, or they never would have set up the Vaccine Court. This isn't that difficult a concept to understand. And if the government by inference acknowledges this as they do in the Vaccine Court, how can the same government then force us to be vaccinated putting our health and lives and the health and lives of our cherished children in danger?

There are already deaths being reported from Gardasil. The heavy promotion of this vaccination in children for a problem, cervical cancer, that is relatively minor and easily treated, is unwarranted and may very well open up the door to greater danger than the problem being addressed.

Please stop the drive for mandates. Though well intentioned such thinking is scientifically misguided, potentially dangerous, and potentially putting the health of millions at risk. If people want to undertake the risk of vaccinations, the risk of contamination with things such as the SV40 virus, if they're ok with the intake of neurotoxic aluminum and mercury, then great, let them be vaccinated. But please, for those of us like myself, a trained research scientist, who see no need to be "protected" but see reasonable danger in vaccinations, we must be allowed to avoid enforced intrusion into our lives, and our health.

Thank you for your consideration.

Sincerely,

Nicholas Gonzalez, M.D.
